

Audit

Mixed corrugators, i.e. corrugators consisting of machines from several manufacturers, are often only viewed from one perspective or are completely neglected because the manufacturer is no longer represented in the market. The contact person who looks at the entire corrugator and the process of making corrugated board is missing here.

Solution

Corr24 offers an external "process audit" of the entire corrugator and the periphery. The audit consists of an on-site analysis of the current status in terms of quality, production, availability, waste reduction, material and energy savings, as well as maintenance, management and operation. The audit is carried out by trainers with many years of experience in the production of corrugated board and other disciplines such as lean management and Six Sigma.

Benefits

- Comparison of standards in process engineering, waste, raw material (paper/glue), management, organization, planning, maintenance and peripheral factors.
→ Definition of goals, analysis and demonstration of the influencing factors on the corrugator in a meaningful report.
- Initiate improvements through targeted service assignments, spare parts or upgrades.
→ Corr24 creates and provides development plans.
- Analysis and demonstration of the influencing factors on the corrugator
→ Production results presented in a network of effects.
- Focus on targeted process training.
- Machine check from the perspective of corrugated board production (process)
→ Focus on detailed machine checks, specific service interventions or maintenance tasks.

Improvements

- Quality
- Production
- Availability
- Waste reduction
- Material and energy savings
- Maintenance and operation
